

## Miniature Package of Drip Irrigation

Technology has influenced all aspects of people's life. Nowadays, they have less interest in growing ornamental plant in their own commercial or residential places.

It must be noticed that the reason for this might be lack of enough time, as a result of much work people are involved in.

When people leave home to travel for a long time; they are often worried of water status of their indoor plants. Also, watering the plants for long periods is probably a boring action for them. A suited solution for the above problems is to use an automatic device undertaken to do this based on a preset program.

In the market, there are a few commercial systems available for this purpose and have many disadvantages.

As its name implies, the present package is a complete hydraulic & electronic set capable of being programmed to irrigate 4 separate irrigation zones (4 set of pots) which allows us to match the system to best suit the site requirements.
